Multi-Winner Voting:

Representation, Manipulation, Deliberation

1. REPRESENTATION

COMMITTEE VOTING, INFORMALLY

COMMITTEE VOTING, FORMALLY

- Voters $N = \{1, 2, \dots, n\}$
- Alternatives $C = \{a, b, c, \dots\}$
- Target committee size $k \in \mathbb{N}$
- Each voter $i \in N$ submits an approval ballot $A_i \subseteq C$
- Collectively, we have a profile of preferences $\mathbf{A} = (A_1, A_2, \dots, A_n)$
- A voting rule F maps each profile $\mathbf{A}$ to a winning committee $W \subseteq C$ with $|W| = k$

Additionally, we define $N(c) = \{i \in N : c \in A_i\}$.

THE STANDARD CONCEPTION: AVOIDING UNDERREPRESENTATION

‘if a cohesive group of voters makes up $x\%$ of the population,
then it should get at least $x\%$ of the seats’

AVOIDING UNDERREPRESENTATION: STATE OF THE ART

- Well-understood and formalised
 - Extended Justified Representation
 - Priceability
 - ...
- Natural and appealing rules provably satisfy it
 - Proportional Approval Voting
 - Method of Equal Shares
 - ...
- **We argue:** Not the last word on representation!

A PROBLEM WITH ‘REPRESENTATIVE’ RULES

A PROBLEM WITH ‘REPRESENTATIVE’ RULES

ANOTHER CONCEPTION: AVOIDING OVERREPRESENTATION

‘if a cohesive group of voters makes up $x\%$ of the population,
then it should **not** decide more than $x\%$ of the seats’

WHY AVOIDING OVERREPRESENTATION?

- Fairness:
 - Prevents groups from having ‘too much’ power
 - Avoids ‘envy’
- Might prevent strategic ‘bullet voting’
- Technical applications
 - Safety in blockchain technologies

N. Boehmer, M. Brill, A. Cevallos, J. Gehrlein, L. Sánchez-Fernández, and U. Schmidt-Kraepelin. Approval-Based Committee Voting in Practice: A Case Study of (Over-)Representation in the Polkadot Blockchain. In *Proceedings of the 38th AAAI Conference on Artificial Intelligence (AAAI-2024)*, pages 9519–9527. AAAI Press, 2024.

FORMALISING OVERREPRESENTATION

‘if a cohesive group of voters makes up $x\%$ of the population,
then it should not decide more than $x\%$ of the seats’

OVERREPRESENTATION: TENTATIVE DEFINITION

In a winning committee W , for every $c \in W$,
the group of voters $N(c)$ should not have

$$|A_i \cap W| > \left\lceil k \frac{|N(c)|}{n} \right\rceil \text{ for all } i \in N(c).$$

OVERREPRESENTATION: TENTATIVE DEFINITION

In a winning committee W , for every $c \in W$,
the group of voters $N(c)$ should not have
 $|A_i \cap W| > \left\lceil k \frac{|N(c)|}{n} \right\rceil$ for all $i \in N(c)$.

OVERREPRESENTATION: TENTATIVE DEFINITION

In a winning committee W , for every $c \in W$,
the group of voters $N(c)$ should not have

$$|A_i \cap W| > \left\lceil k \frac{|N(c)|}{n} \right\rceil \text{ for all } i \in N(c).$$

OVERREPRESENTATION: TENTATIVE DEFINITION

In a winning committee W , for every $c \in W$,
the group of voters $N(c)$ should not have

$$|A_i \cap W| > \left\lceil k \frac{|N(c)|}{n} \right\rceil \text{ for all } i \in N(c).$$

OVERREPRESENTATION: TENTATIVE DEFINITION

In a winning committee W , for every $c \in W$,
the group of voters $N(c)$ should not have

$$|A_i \cap W| > \left\lceil k \frac{|N(c)|}{n} \right\rceil \text{ for all } i \in N(c).$$

OVERREPRESENTATION: TENTATIVE DEFINITION

In a winning committee W , for every $c \in W$,
the group of voters $N(c)$ should not have

$$|A_i \cap W| > \left\lceil k \frac{|N(c)|}{n} \right\rceil \text{ for all } i \in N(c).$$

THE DEFINITION HAS A BUG

Say we want to select $k = 6$ candidates. Consider the following profile:

- $A_1 = \{a, b, c\}$
- $A_2 = \{d, e, f\}$
- $A_3 = \{g\}$

Each voter can get at most $\lceil 6 \cdot \frac{1}{3} \rceil = 2$ candidates. Any committee overrepresents some voter:

- $\{a, b, c, d, e, f\}$ overrepresents voter 1 and voter 2
- $\{a, b, c, d, e, g\}$ overrepresents voter 1
- etc...

JUSTIFIED UPPER QUOTA (JUQ)

In a winning committee W , for every $c \in W$, if the group of voters $N(c)$ has

$$|A_i \cap W| > \left\lceil k \frac{|N(c)|}{n} \right\rceil \quad \text{for all } i \in N(c),$$

then there cannot be $d \in C \setminus W$ and $N' \subseteq N(d)$ such that

$$|A_i \cap W \setminus \{c\} \cup \{d\}| \leq \left\lceil k \frac{|N'|}{n} \right\rceil \quad \text{for all } i \in N'.$$

JUSTIFIED UPPER QUOTA (JUQ)

In a winning committee W , for every $c \in W$, if the group of voters $N(c)$ has

$$|A_i \cap W| > \left\lceil k \frac{|N(c)|}{n} \right\rceil \quad \text{for all } i \in N(c),$$

then there cannot be $d \in C \setminus W$ and $N' \subseteq N(d)$ such that

$$|A_i \cap W \setminus \{c\} \cup \{d\}| \leq \left\lceil k \frac{|N'|}{n} \right\rceil \quad \text{for all } i \in N'.$$

JUSTIFIED UPPER QUOTA (JUQ)

In a winning committee W , for every $c \in W$, if the group of voters $N(c)$ has

$$|A_i \cap W| > \left\lceil k \frac{|N(c)|}{n} \right\rceil \quad \text{for all } i \in N(c),$$

then **there cannot be** $d \in C \setminus W$ and $N' \subseteq N(d)$ such that

$$|A_i \cap W \setminus \{c\} \cup \{d\}| \leq \left\lceil k \frac{|N'|}{n} \right\rceil \quad \text{for all } i \in N'.$$

JUSTIFIED UPPER QUOTA (JUQ)

In a winning committee W , for every $c \in W$, if the group of voters $N(c)$ has

$$|A_i \cap W| > \left\lceil k \frac{|N(c)|}{n} \right\rceil \quad \text{for all } i \in N(c),$$

then there cannot be $d \in C \setminus W$ and $N' \subseteq N(d)$ such that

$$|A_i \cap W \setminus \{c\} \cup \{d\}| \leq \left\lceil k \frac{|N'|}{n} \right\rceil \quad \text{for all } i \in N'.$$

JUSTIFIED UPPER QUOTA (JUQ)

In a winning committee W , for every $c \in W$, if the group of voters $N(c)$ has

$$|A_i \cap W| > \left\lceil k \frac{|N(c)|}{n} \right\rceil \quad \text{for all } i \in N(c),$$

then there cannot be $d \in C \setminus W$ and $N' \subseteq N(d)$ such that

$$|A_i \cap W \setminus \{c\} \cup \{d\}| \leq \left\lceil k \frac{|N'|}{n} \right\rceil \quad \text{for all } i \in N'.$$

JUQ FIXES THE BUG...

Let $k = 6$ and consider again:

- $A_1 = \{a, b, c\}$
- $A_2 = \{d, e, f\}$
- $A_3 = \{g\}$

Recall: each voter can get at most $\lceil 6 \cdot \frac{1}{3} \rceil = 2$ candidates.

Committee $\{a, b, c, d, e, g\}$ **satisfies** JUQ:

- **Voter 1** is overrepresented, must kick out c
- But: **voter 2** already at quota
- Thus, no need to swap c with f

...BUT NOT TRIVIALY SO!

Let $k = 6$ and consider again:

- $A_1 = \{a, b, c\}$
- $A_2 = \{d, e, f\}$
- $A_3 = \{g\}$

Recall: each voter can get at most $\lceil 6 \cdot \frac{1}{3} \rceil = 2$ candidates.

Committee $\{a, b, c, d, e, f\}$ **fails** JUQ:

- **Voter 1** is overrepresented, must kick out c
- **Voter 3** is underrepresented
- Thus, must swap c with g

WHICH RULES SATISFY JUQ?

Consider the standard family of Thiele rules:

Definition

Given a non-increasing $\omega: \mathbb{N} \rightarrow \mathbb{R}_{\geq 0}$, the ω -Thiele rule picks a committee maximising

$$\sum_{i \in N} \sum_{\ell=1}^{|A_i \cap W|} \omega(\ell)$$

Examples:

- **Approval Voting:** $\omega(\ell) = (1, 1, 1, \dots)$, which selects the **most-approved** candidates
- **Proportional Approval Voting:** $\omega(\ell) = (1, \frac{1}{2}, \frac{1}{3}, \dots)$, which **avoids underrepresentation**
- **Chamberlin-Courant:** $\omega(\ell) = (1, 0, 0, \dots)$, which **'covers'** as many voters as possible

TERRIFYING NEWS

Proposition

No Thiele rule satisfies JUQ.

EXTENDING THIELE RULES

We define **composite Thiele rules**, which work in stages of tiebreaking:

Definition

Given a **sequence** of non-increasing $\omega_1, \omega_2, \dots: \mathbb{N} \rightarrow \mathbb{R}_{\geq 0}$, the corresponding composite Thiele rule picks a committee as follows:

1. First, select **all** committees maximising the score of ω_1 ;
2. Among those, select all committees maximising the score of ω_2 ;
3. Repeat until you are left with a single committee (or without scoring functions).

Theorem

*There is a **unique** composite Thiele rule that satisfies JUQ: we called it **Adams Approval Voting**.*

ADAMS APPROVAL VOTING: DEFINITION

The rule is named after the sixth president of the United States, John Quincy Adams, and the electoral formula he proposed.

Definition

Adams Approval Voting is the composite Thiele rule defined by

1. $\omega_1(\ell) = (1, 0, 0, 0, 0, \dots)$ and
2. $\omega_2(\ell) = (1, 1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \dots)$.

We adapt it from parliamentary elections to committee voting.

ADAMS APPROVAL VOTING: EXPLANATION

Concretely, the rule proceeds as follows:

1. Select all committees W maximising the number of ‘covered’ voters, i.e., that maximise

$$|\{i \in N : A_i \cap W \neq \emptyset\}|$$

2. Among those, select all committees W' that maximise

$$\sum_{i \in N} \sum_{\ell=2}^{|A_i \cap W'|} \frac{1}{\ell - 1}$$

OTHER RESULTS: OVERREPRESENTATION

- We show that one can find a JUQ committee in polynomial time
- We study another perspective on overrepresentation: balancing over- and underrepresentation
 - We introduce another axiom, **justified near quota**, and get analogous results
- We study the relationship between our axioms and established underrepresentation axioms (EJR+)
 - We show that some natural avenues in proving compatibility fail

2. MANIPULATION

SEQUENTIAL VOTING

- Voters $N = \{1, 2, \dots, n\}$ (fixed throughout)
- Pre-set number of rounds $k \in \mathbb{N}$:
 - Alternatives C_1
 - Alternatives C_2
 - ...
 - Alternatives C_k
- For each round r , every voter $i \in N$ submits an approval ballot $A_i^r \subseteq C_r$

SEQUENTIAL VOTING

- Voters $N = \{1, 2, \dots, n\}$ (fixed throughout)
- Pre-set number of rounds $k \in \mathbb{N}$:
 - Alternatives $C_1 = \{a, b, c, \dots\}$
 - Alternatives $C_2 = \{\blacktriangle, \blacksquare, \blacklozenge, \dots\}$
 - ...
 - Alternatives $C_k = \{\text{red circle}, \text{blue circle}, \text{green circle}, \dots\}$
- For each round r , every voter $i \in N$ submits an approval ballot $A_i^r \subseteq C_r$

SUMMARY: MANIPULATION

Using this fact, we show:

- For a large class of rules, it is **computationally hard** to decide if free-riding is beneficial
- That the **risk** of free-riding is **non-neglibile** (via simulations)

MESSAGE

FREE-RIDING is unavoidable in 'fair' sequential voting,
but it is risky and its consequences hard to predict! ✓

3. DELIBERATION

SUMMARISING DISCUSSIONS

ProportionalParrot

A party's share of seats in the House of Commons should reflect its share of the popular vote.

111 

MajoritarianMango

In systems with PR, opinions are too strongly divided and nothing gets done.

11 

PastThePost

FPTP results in more stable governance.

39 

VDHondt41

PR will reduce hyper-partisanship and promote cooperation between parties.

88 

JohnCitizen

PR will reduce wild policy swings and result in more long-lasting policies.

89 

SingleTransferableLarry

I like the simplicity of stating my favorite candidate, as well as alternative choices.

8 

TommyHill

STV's advantage over MMP is that it doesn't explicitly enshrine political parties in our electoral system.

9 

PhanMinh_AF

MMP has a better chance of obtaining public support than STV due to its relative simplicity.

6 

SUMMARISING VIA APPROVAL VOTING

COMBINING ARGUMENTATION AND VOTING

COMBINING ARGUMENTATION AND VOTING

COMBINING ARGUMENTATION AND VOTING

COMBINING ARGUMENTATION AND VOTING

SUMMARY: DELIBERATION

We...

- ...define a formal of discussions (**argumentation framework** + **argument approvals**)
 - Outcomes are sets of extensions filtered using the approvals
- ...quantify the representativeness of an outcome
- ...introduce outcome-selection algorithms based on multi-winner voting ideas
- ...study the rules **computationally**, **axiomatically** and **experimentally**

CONCLUSION

RECAP

- **Representation:**
 - We introduced formal definitions of overrepresentation-avoidance in committee voting, and rules that implement them.
- **Manipulation:**
 - We studied free-riding in sequential voting, and show that it is not as appealing a strategy as one might think.
- **Deliberation:**
 - We introduce an approach for summarising online discussions combining argumentation and voting theory.
